

Abstract of the Disclosure

The described system and methods provide a secure document delivery system that allows for high-security, high-volume e-mail delivery of documents. The security is provided through encryption and decryption of messages and documents through a browser based software application. The system also provides for tracking the progress of the delivery of each document in a tracking database. It provides a seamless interface to the recipient using existing e-mail client programs and browsers with no additional requirements for installation of special software. Optionally, the system can provide round trip capability for applications that need it.
